

Quick recap of Session 1.

Task 1. Part 1: Knowing the data

Fields:

Field name	Data type + data subtype	Kind: temporal? geographical? Other?	Domain and value range in dataset	Unit and required precision	Update frequency?

Groupings and relationships.

Distributions. Missing data? Incoherences? Real or forecast data? Outliers?

Draw some charts to explore them.

From EDA to visualization

What are the main insights from the Exploratory Data analysis?

What story do we want to tell?

Which charts are the most suitable for the data and analysis?

GitHub

Upload the GitHub student contents in your GitHub.

Create an image 800 x 450 pixels and include it in your HTML page task01.html

Explain your main findings in 200 to 300 words and include the explanation in your HTML page task101-explanation.html

Task

You can upload this pretask to Task1 delivery and you'll get my feedback.

Presentation and Visualization

Task wording

Part 1: Exploratory Data Analysis (EDA): Data (bottom-up): Study and describe the data + explore relationships 15%

This part shall describe the data in a thorough way in order to plan the visualization from a bottom-up perspective. Analyse the data and the associated documentation. For each field, clarify what type of data it is, whether it has a temporal or geographic nature, what its value range and domain are, which units it uses, and what level of precision is required. Examine the distribution and identify outliers. What is the currency or timeliness of the data? How often should it be updated? Identify groupings and relationships among the different fields and their characteristics. Create several charts to explore distributions and relationships. Look for missing data, incoherences, real or forecast data... Comment on the findings.

Based on this exploratory study, determine which fields to include in the final visualization and which relationships to highlight. Deliver a detailed description of the data and the exploratory charts.
